

Abstract

A hair fluid applicator includes a plurality of hollow teeth, with a threaded receiver top which can accommodate a standard plastic bottle. There is a vertical opening-instead of holes-at the tip of each tooth enabling quick fluid dispense in all directions within 180 degrees and 360 degrees range. Three layers of hollow teeth arranged in a zigzag position coat the same hair with hair fluid three times in one brush. Such design and arrangement of teeth allow deep penetration, and even and quick distribution of the fluid.
